HAENNI
SCALES

Swiss-based weighing specialist, *HAENNI*, is offering fixed installations of its mobile weighing system, the WL-103.

The scale's original field of application was predominantly mobile weighing used by law enforcement personnel. Now however, many of *HAENNI*'s customers are asking to use the scales as a fixed installation that capitalizes on lower operation cost.

As a result of the axle suspension's design and its spring rate characteristics, friction and brake reaction forces, *HAENNI* has developed an installation frame made of corrosion-proof materials, equipped with a cable slot to enable fixed weighing. The frame's design ensures a recess of exactly the scale's height and protects the pavement from crumbling away while maintaining its level until the grout has set.

The level reference is set at the location where the non-weighted axles of an axle group remain, while the other axle is weighed. This approach makes accurate measurements possible at locations where the surrounding pavement is irregular.

The first frames have been successfully installed in a couple of vehicle inspection facilities in Germany.
